

Arjun Giriraj Day 20

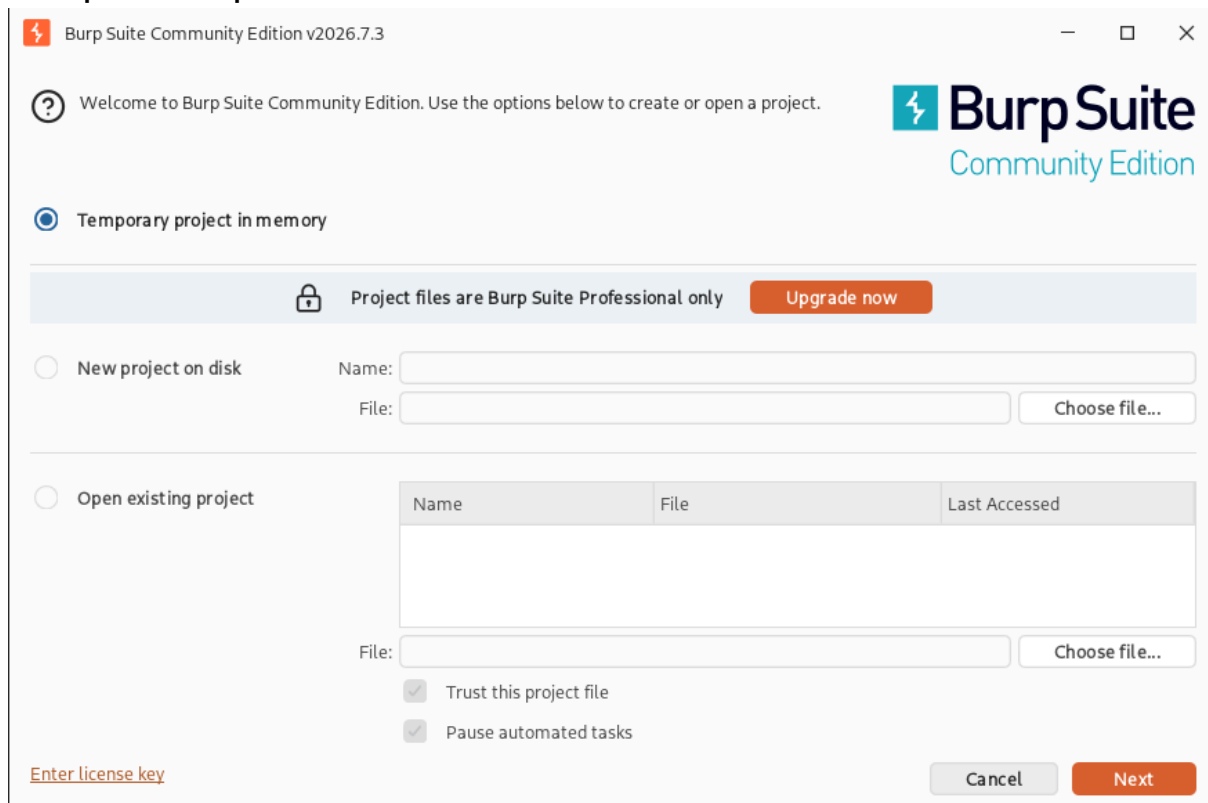

- What is Burp Suite?
Burp suite is a web security testing tool created by the portswigger. It is used by professionals to analyze or inspect the communication between the web browser and application.
- Why is Burp Suite useful for web application security?
Because it is used to inspect HTTP requests, HTTP responses, and headers, it can repeat authorized requests with different parameters.
- What is Burp Proxy?
Burp proxy sits between the browser and web application.
- Explain the Browser → Burp → Web Server flow.
The user sends requests to the web application, and the Burp proxy intercepts that request and allow user to inspect or analyze before it can be forwarded to web application.
- What does Intercept ON mean?
Intercept ON means the burp proxy will start catching the request and put them on hold until the user itself forward those requests.
- What does Intercept OFF mean?
Intercept OFF means the web browser will send the request to web application without being intercept.
- What does Forward do?
Forward allow the request to continue after the request is being intercepted by proxy.
- What is Burp's built-in browser?
Burp built-in browser does not need to be configured for Burp proxy, and it is good for beginners.
- Why is the built-in browser useful for beginners?
Because it is already configured with the proxy settings.

- What is HTTP History?
The record of observed traffic is HTTP history.
- What information can HTTP History show?
It may contain Host, Method, URL, Status, Length, MIME type, Request, and Response.
- What is a target?
Target contains the information of the targeted site the user is doing operation on.
- What is scope?
Scope defines what system or application is authorized for testing.
- Why must a security tester have authorization?
Authorization is required because using burp suite against the system without permission is illegal.
- What is Burp Repeater?
It repeats the same request but security tester may modify that request according to the response he expects.
- Explain the HTTP History → Send to Repeater → Send → Response workflow.
From the HTTP history, the security tester can send any individual request to the repeater. Now the tester can modify that request and hit send and he will get the response according to the request is he modified.
- What is the difference between an HTTP request and response?
HTTP request is sent by the browser and web application responds with the HTTP response.
- What sensitive information should never appear in student screenshots?
Password, API tokens, Personal information, Authentication cookies, etc.

- Why should students not test random public websites? Explain the purpose of Day 20 in your own words.
Student should not test random public websites without proper authorization as it violated the privacy and security law which is illegal. Day 20 focuses on teaching the burp suite basics so the student can focus on burp suite more with their base knowledge is clear.

Include safe screenshots showing:

- Burp Suite open

- Proxy / Intercept
